[†] Figures do not include NGLs and oil from nonconventional sources.

* Includes approximately one-half of Neutral Zone production.

** Includes the UK offshore, Norway, Denmark, The Netherlands offshore, and Germany offshore.

*** Does not include North Sea.

¹Includes crude oil, lease condensates, natural gas plant liquids, other hydrocarbons for refinery feedstocks, refinery gains, alcohol, and liquids produced from nonconventional sources.

Build better subsea production.

With an open system from Weatherford, adding or retrofitting equipment becomes far simpler because you are no longer tied to a single manufacturer's communication protocol, pricing or delivery schedule. And you can use your existing power lines for high-speed communications.

Open up your subsea network. Weatherford's production control and communication systems work with trees from all major manufacturers, enabling you to easily combine previously incompatible systems. Because you can mix and match devices on the sea floor, you increase your options for expanding subsea fields or for retrofitting new designs while delivering state-of-the-art monitoring, control and data management. Who would have thought you could simplify subsea operations while increasing speed, flexibility and performance? Weatherford did. For more information on opening your existing subsea system for state-of-the-art control, communications and data management, visit weatherford.com.

Weatherford helped StatoilHydro upgrade subsea communications and increased the number of downhole gauges from the Visund platform. The operator can now monitor performance in wells with more complex reservoir structures and increase the overall speed and reliability of communications.

The open database structure allows the dissemination of data from all subsea devices to real-time operational and historic databases.
